### **ACKNOWLEDGMENT**

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service expresses its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under U. S. D. A. programs. Others contributing information were the Florida Department of Agriculture, Agricultural Experiment Stations and Cooperative Extension Service.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, U. S. D. A., Florida Department of Agriculture; and Florida Agricultural Experiment Station. Acreage, production, and value data are official statistics assembled under the direction of Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service.

## SUMMARY OF THE 1974 FIELD CROPS SEASON

This publication, released annually, contains statewide estimates of acreage, yield, production, price and value of production for all major field crops grown in Florida for the years 1969 through 1974. County estimates for corn, wheat, soybeans, peanuts and tobacco are also shown for these years. County estimates for the major cotton producing counties are shown for the years 1973 and 1974. The complete series of crop estimates for the State is available from this publication, "Field Crops Summary, 1972 and 1973" and the publication "Field Crops Summary, 1919 - 1967". All of these publications are available upon request.

The 1974 season was a good year for most field crops as record high yields were realized for tobacco, hay and peanuts. Yields were about average for other field crops. Season average prices were at, or near, record levels for practically all crops except cotton. The average price of sugarcane showed the sharpest increase from the previous season, moving to a new high of \$44.44 per ton. Total harvested acreage of field crops continued to increase.

Temperatures during January averaged well above normal while rainfall was variable. Temperatures dropped below freezing on February 10 causing some damage to sugarcane and more freezing temperatures occurred over the State except South Florida on February 26 and 27. The early spring was generally dry, and planting of field crops moved forward on schedule. There were no adverse weather conditions and crops made good progress during the season. The fall was generally dry and was near ideal for harvesting crops, however, localized showers from time to time caused some interruptions. Dry soils delayed seeding of small grains and slowed germination of grains that had been sown. Sugarcane harvest got underway on schedule and increased rapidly into the winter months.

The planted and harvested acres of corn continued the upward trend of recent years. Planted acres were the largest since 1968 and acres harvested for grain the largest since 1967. The average yield per acre was 48 bushels compared with 43 bushels in 1973. The yield was the third highest of record. The season average price jumped from \$2.55 in 1973 to a record \$3.30 per bushel. The increase in harvested acres and yield per acre, combined with the sharp increase in price, pushed the value of production to a record \$63,043,000, a 73 percent increase from 1973.

The value of sugarcane reached a record level of \$344,899,000, over one-half times larger than 1973. The season average price took a very sharp jump from \$26.40 per ton in 1973 to \$44.44 in 1974. The increase in total value is attributed to the increased price per ton as yields were below 1973. Yield per acre was 28.5 tons, the lowest since the 25.7

tons in 1943. Total acreage harvested for sugar and seed was 272,000 acres, an increase of over 2 percent from 1973.

A late February freeze caused some damage to the crop and was the main contributing factor to the lower yields. Sugarcane continues to be the State's most valuable field crop.

Acreage planted to soybeans continued the upward climb in 1974 making it the 13th consecutive year of increase. Acres planted to soybeans is now second only to corn in total acres planted to a field crop. The acres harvested for beans totaled 279,000 acres, a 10 percent increase from 1973. The average yield in 1974 was 27 bushels per acre compared with 24 bushels the year before. The season average price increased from \$5.65 in 1973 to \$7.30 in 1974. The upward trend in acres, a better than average yield combined with the record season average price, pushed the value of production to a new high of \$54,991,000.

The production of hay in Florida was given quite a boost in 1974 when acreage harvested jumped 8,000 acres to 197,000 acres, a new record. The average yield per acre passed the 2 ton mark and reached 2.10 tons and was also a record high. The average price took a 31 percent jump from \$43.50 to \$57.00 per ton. The value of production, at \$23,598,000, was almost half again the value of the 1973 crop.

The acreage planted to cotton in the State dropped by only 100 acres but harvested acreage increased by 600 acres from 1973. The yield in 1974 averaged 503 pounds per acre compared with 522 pounds the year before. The average price, at 39 cents per pound, was down 12 cents from the 51 cents received in 1973. The drop in price was the main factor in the sharp decline in value of production. Santa Rosa County dominates in cotton production with 89 percent of the total cotton produced in the State in 1974.

Total acreage planted to peanuts continued the downward trend of recent years however, acreage harvested for nuts and harvested as green peanuts remained steady at 55,000 acres. A record yield of 3,100 pounds per acre was realized in 1974. The season average price at a record 18 cents per pound combined with the record production pushed the value of production to \$30,690,000, an increase of 24 percent from 1973.

The acreage of flue-cured tobacco grown in the State in 1974 was practically the same as 1973. While acreage harvested increased by only 100 acres, average yield rose to record 2,145 pounds per acre. For the first time since records have been kept, the season average price was above \$1.00 per pound. The record yield and average price raised the value of production to a new high, from \$18,476,000 in 1973 to \$25,348,000, a gain of 37 percent. Shade tobacco acreage continued to decline, and even though average yield was at a record, total production was less than 1973. The average price, at \$3.80 per pound, was only 30 cents above the price in 1973.
